

## Urban Lighting Zones:

For any lighting placed within and along roadways in the Town, the patterns of illumination from this lighting shall be consistent with the categories shown below and on The proposed types are broken down as follows and depicted on the Urban Lighting Plan map below:

1. **Regional Arterial - Urban light level:** where secondary photo metric cones can touch or overlap in a limited number of areas but the primary photo metric cones are independent and do not touch.
2. **Town Arterial - Parkway light level:** where clusters of light fixtures allow secondary photo metric cones to touch/overlap within the cluster only. Primary photometric cones do not touch.
3. **Pastoral Roadway - Rural light level:** which is limited to isolated pools of light, usually at intersections.
4. **Rural Arterial - Thematic light level:** where secondary photometric cones touch/overlap at intersections and street scale fixtures are generally limited to intersections or other places of safety need and the lighting between street fixtures is achieved with Pedestrian scale trail lighting (bollards or other pedestrian scale fixture). Landscape lighting may also be used. It is a landscape illuminated presentation. This could be the feel of the Town edge.
